FUJIFILM

Overview of 3D LUTs for F-Log2   Ver.1.1

1. Introduction

This document describes the features of the 3D LUTs (3-Dimension Look-Up Tables) for F-Log2 which are loaded on FUJIFILM digital cameras. Each of the 3D LUTs is a preset for tone and color reproduction in the primary color correction for a movie production, which can be loaded into movie editing software.

2. Types of the 3D LUTs

1）FLog2_FGamut_to_ETERNA_BT.709

It is designed to create Film Simulation "ETERNA" image where the gamut complies with ITU-R BT.709.

2）FLog2_FGamut_to_ETERNA-BB_BT.709

It is designed to create Film Simulation "ETERNA BLEACH BYPASS" image where the gamut complies with ITU-R BT.709.

3）FLog2_FGamut_to_WDR_BT.709

It is designed to create a neutral image where the black level is 0 by 10 bit and where the gamut complies with ITU-R BT.709.

4）FLog2_FGamut_to_FLog2_BT.709

It is designed to create a neutral image where the black level has an offset as its tone is the same as the F-Log2 data. This gamut also complies with ITU-R BT.709.
